The AutoCAD mobile app is available on both Apple iOS and Google Android. In 2013, the mobile version of AutoCAD was the 2nd most popular CAD app in the Apple app store with over a million downloads. AutoCAD Enterprise is a commercial, cloud-based CAD and drafting software application for design professionals. The Enterprise version is available for both desktop and mobile use. It has been named the best overall application of the last three decades by readers of CAD user magazine Render Magazine and in the same period was named the most innovative application in the same publication, CADUser Magazine's 50 years of Innovation. Autodesk acquired AutoCAD and AutoCAD LT (a more functional CAD product) in 1994. AutoCAD History AutoCAD and AutoCAD LT, both produced by Autodesk, were introduced in 1982, along with the Intel 80386 processor, now known as the i386. The first version of AutoCAD was designed to be portable (on floppy disks). The earliest versions of AutoCAD required DOS 3.3 or later and included drawing objects, dimension, and text. The ability to publish your drawings was added in 1985. AutoCAD LT was the first version of AutoCAD to allow you to import DWG files from other CAD applications and files from other sources. This feature, a necessity for the flexible workflow of AutoCAD, would remain in all subsequent AutoCAD releases. The popularization of the spreadsheet application Lotus 1-2-3 was a major factor in the increased demand for AutoCAD. One of the users of Lotus 1-2-3 was Pauline Lally, a writer and typist, who was also an Autodesk employee. During her time at Autodesk, she wrote the first version of AutoCAD for DOS. She is now remembered by the acronym ALAL (after she left Autodesk), and has taken credit for creating the acronym "DWG" in honor of the company's release of AutoCAD 4.0. The first version of AutoCAD for

I've tried reading all I could find on the web but haven't been able to find a good enough tutorial. I have a class that holds a pair of pointers to the things I want to queue. The threads that queue and dequeue things must not be allowed to access these data members concurrently. I have the following class: typedef boost::mutex queue_mutex_t; typedef boost::condition_variable queue_cond_t; class queue_t { queue_mutex_t mutex; queue_cond_t cond_; int qidx; std::pair pair[]; }; I've already found a basic implementation of a queue_t object in the Boost threads mailing list and I think the problem lies here. I need to be able to wait on
