"We have registered significant declines in the number of new HIV infections, including a drop in new infections among women. This shows that the comprehensive approach we have developed in the response to HIV among young people (called the "Young People's Plan") is working. Although the number of new HIV infections in young people has not decreased as much as in the general population, the trend over the last few years is good. However, the HIV epidemic continues to pose a grave threat to young people. While significant achievements have been made, we still need to do more. "We also need to strengthen HIV prevention for other groups, and work harder to eliminate mother-to-child HIV transmission, which is still responsible for a large number of new infections every year. To achieve the targets we have set, we must continue to strengthen the response to HIV in our country and in the world." of life. If nothing can be done, then so be it. I suspect that the concern over "financial efficiency" is just a red herring. I think the real worry is that if we are more efficient at paying for education, then there will be less spending on education, and therefore a smaller educational pie for everyone to take a share of. This is what makes the optimists and the pessimists each so nervous. You need look no further than California's education costs to see how much some people are willing to squander on a system they simply do not believe in. If you think that the education spending pie is smaller than it otherwise would be if the government weren't dictating spending levels, then I'm with you. I think the price of liberty is too high, and that the upside to a dictatorship is not enough for me to accept it. I have no idea where this idea comes from that the government should not spend money "to educate people", but that seems to be the crux of the political argument.
