AutoCAD History: 1980s The original AutoCAD computer app (January 1983) is a raster graphics software application designed for 2D vector drafting, plotting and technical illustration. The software was sold for \$1,995 in its original release, but in 1985, the price rose to \$3,495. Unlike CAD programs of today, it did not include 3D capabilities. In 1983, Autodesk incorporated, and in 1984, the company released the first release of AutoCAD, Version 1.0. However, it was the 1988 release, when AutoCAD 2.0, that really ignited the revolution. AutoCAD 2.0 introduced 3D graphics, a drafting tablet, AutoCAD-compatible vector-graphics technology called dBase IV and a group of powerful new commands including the “carpenter’s glue” command for vector join editing. The 1989 release, AutoCAD 3.0, introduced 3D modeling, a new layer stack feature, AutoCAD-compatible spreadsheet and database tools, AutoCAD’s new powerful command set – including the “surveyor’s ax” command for measuring, the “compass” command for drafting, and the “baseball” command for framing lines and faces. In 1992, with the release of AutoCAD 1993, AutoCAD’s 3D modeling was further refined and improved. It was then, and is still today, recognized as one of the best design and drafting tools in the market. The 1995 release of AutoCAD 4.0 added even more powerful functions including new drawing tools, complex drawing commands, and a redesigned and streamlined user interface. AutoCAD 4.0 also introduced the “AutoCAD Move Tool” for moving objects and onscreen lists, the “Modifier” tool for handling both vector and raster data, the “Duplicate Tool” for copying and reversing, the “Detail Surface” tool for manipulating surfaces and

“Smooth” surface editing. AutoCAD 1996 marked the beginning of the most significant AutoCAD upgrades of all time. AutoCAD 3.1 added the ability to make and edit dimensions and created the first version of the “Model Browser”. AutoCAD 3.2 added a “Multisegmental” tool and introduced what would

Networking The AutoCAD architectural applications, including the command line interface and Desktop Manager, use communication protocols such as HTTP and FTP to exchange drawing files and data. Implementations Third-party software developers can use AutoCAD and make their own modifications to the application or develop their own autodesk-dwg-based application. The following list of software is widely used by many AutoCAD designers. Modular design Macro recorder Macro recording is a means of recording a series of commands on a form in AutoCAD without actually executing them. The commands that can be recorded may be recorded as either text commands or as AutoCAD commands. Data linking Data linking allows the tracing of data from one AutoCAD drawing to another. For example, a list of all data entities from one drawing can be used to pull data in a different drawing. Data clipping Data clipping allows one part of a drawing to be visible or invisible at a specific point. Architectural design Project management and drawing management Project management applications support the management of projects with AutoCAD. These applications manage the schedule, changes to the project, costs, and other information associated with a project. They can also support other CAD software, including AutoCAD. In addition, drawing management applications are available for AutoCAD. These applications provide easy access to edit and create drawings. Zoom functions Autodesk introduced the Zoom toolbar in AutoCAD 2012. In AutoCAD 2016, the zoom toolbar was replaced by the Zoom tool. Users can also control the zoom tool with keyboard shortcuts. Modeling Three-dimensional modeling applications (or CAD applications) are designed to provide the best experience for designers of 3D objects. AutoCAD Architecture is designed to work with Autodesk Navisworks, another 3D modeling software. Add-on products AutoCAD product extensions, sometimes referred to as add-on products, provide customers with extra functionality not provided by Autodesk. For example, Autodesk Architecture provides 3D modeling capabilities to architects. Two-way fluorescence in situ hybridization in the diagnosis of a recurrently translocated chromosome 13 in a patient with chronic myelomonocytic leukemia. Chromosomal rearrangements of chromosome 13 have been identified as prognostic markers in chronic myelomonocytic leukemia (CMML). We describe a patient with CMML who displayed a low-level 46,XX,t(13;16)(q14;p13) in leukemic cells of 6 months' duration, a persistent increase in monocytosis and persistent infection by *Candida albicans*. The patient progressed to death within a year from presentation, with marked myelodysplastic features on his bone marrow cells. Chromosome analysis of bone marrow cells at the time of death revealed the same t(13;16)(q14;p13) as seen in the cells from presentation, together with a translocation of chromosome 9q34 to chromosome 15q24. Fluorescence in situ hybridization (FISH) using an alpha-satellite probe for chromosome 9q34 showed that the translocation involved the centromeric region of chromosome 9 in addition to the translocated chromosome 13. Similarly, FISH using an alpha-satellite probe for chromosome 15q24 showed the presence of a translocated chromosome 15 in addition to the translocated
