We report here a novel germ line mutation of the beta-globin gene in a Korean family with sickle cell anemia. A novel mutation of the beta-globin gene was identified by screening the beta-globin gene by single strand conformation polymorphism analysis. Direct sequencing and restriction endonuclease analysis revealed a G to C substitution at codon 41 (betaA-Glu41Gln). The substitution alters a GATA box at the 3'-end of the beta-globin gene, which is a critical factor for high expression of the beta-globin gene. This substitution was also present in all affected family members, although the severity of the disease was variable.This is a political forum that is non-biased/non-partisan and treats every persons position on topics equally.
